

- **How would you represent testing of the application with multiple browsers?**
-By using Fork
- **Can the generation of the patch file and update the Subversion repository be done concurrently?**
-Patch file will contain information about how to update the repository, and we can not directly update it parallelly otherwise, there will be anomalies in it.
- **Can patching the production code and updating the Subversion repository be done in parallel?**
-Yes because, Patching the production code and updating the Repository are independent events.
- **Identify the basic units of work, and visualize the workflow**
-Creating a local repository of code, making changes, committing or testing it, and then creating a patch file to update the final repository.
- **Identify activities that could be done in parallel.**
-Testing on different Browsers, ex. Firefox, Edge, Chrome, etc.
-Identify stages from where progress could be made only after a list of criteria is satisfied.
If both the browsers' testing is successful, then only patch files can be created
